
Is utg glass solar

What is a UTG & how does it work?

The UTG is specifically designed for use in space applications such as a cover glass for PV whereby it is laminated atop of the solar cells. Its cerium content provides protection from high energy radiation.

Is ultra-thin glass a suitable substrate for CdTe solar cells?

Flexible metallic and polyimide foils are frequently used, but in this work an alternative substrate with attractive properties, ultra-thin glass (UTG) has been employed. CdTe solar cells with average efficiency reaching 14.7% AM1.5G efficiency have been produced on UTG of 100 um thickness.

Can cadmium-free solar cells be used on ultra-thin glass?

The new cell concept was introduced in the study " High-efficiency cadmium-free Cu (In,Ga)Se 2 flexible thin-film solar cells on ultra-thin glass as an emerging substrate," published in the Journal of Alloys and Compounds.

What are the advantages of a UTG substrate?

The UTG substrate used in this work offers several advantages such as low chemical contamination, low surface roughness, mechanical flexibility and high temperature resistance. The UTG is specifically designed for use in space applications such as a cover glass for PV whereby it is laminated atop of the solar cells.

The UTG substrate used in this work offers several advantages such as low chemical contamination, low surface roughness, mechanical flexibility and high temperature resistance.
