# Liquid flow battery cell

What is a flow battery?

A flow battery is an electrochemical energy storage system that stores energy in liquid electrolyte solutions. Unlike conventional batteries, which store energy in solid electrodes, flow batteries rely on chemical reactions occurring between the liquids stored in external tanks and circulated through the battery's electrochemical cell.

Are flow batteries scalable?

Scalability: One of the standout features of flow batteries is their inherent scalability. The energy storage capacity of a flow battery can be easily increased by adding larger tanks to store more electrolyte.

Are flow batteries a good choice for large-scale energy storage applications?

The primary innovation in flow batteries is their ability to store large amounts of energy for long periods, making them an ideal candidate for large-scale energy storage applications, especially in the context of renewable energy.

How does a flow battery store energy?

A flow battery stores energy in two soluble redox couples, which are comprised of exterior liquid electrolyte containers. During charging, one electrolyte is oxidized at the anode, while during discharging, another electrolyte is reduced at the cathode.
